PIN SCREEN
Place your palm below the table.
Touch the pins and raise your palm
slowly. Observe the impression on
the pin screen. You will see the
impression of your palm. Now try the
same on the other side pin screen.
Do you find any difference?
The screen having smaller and
closely packed pins gives a better
impression than the one having
bigger pins and/or pins at a
greater distance. In fact the number
of pins per unit area (resolution)
decides the clarity of impression.
This principle is used in greyhound
generation and printing.
